On separate cards have the following:

**SUPPORT**

**PROTECTION**

**MOVEMENT**

**MINERAL STORAGE**

**BLOOD CELL PRODUCTION**

**ENERGY STORAGE**

Bones provide a framework for the attachment of muscles and other tissues.

Bones such as the skull and rib cage protect internal organs from injury.

Bones enable body movements by acting as levers and points of attachment for muscles.

Bones serve as a storage place for calcium and phosphorus, essential minerals for the body.

The production of blood cells occurs in the red marrow found within the cavities of certain bones.

Lipids, such as fats, stored in the yellow marrow serve as an energy reservoir.
